Freight Spend Intelligence Report

Sample Corp — Q3 2025 Analysis | 142 shipments | 4 carriers | 8 lanes

TOTAL IDENTIFIED ANNUAL SAVINGS

\$38,420

Across carrier reallocation, lane repricing, driver coaching, and invoice anomalies

\$14,200 Carrier reallocation LP-optimized	\$11,520 Invoice anomalies IQR-detected	\$8,400 Lane optimization ABC model	\$4,300 Driver coaching SPC-flagged
--	---	---	---

Top 3 actions by financial impact

01	Shift 40% of Carrier B volume to Carrier A on the Dallas → Houston lane Carrier A delivers on-time 72.4% vs Carrier B at 41.3%, and costs \$96/shipment less. LP optimization confirms this is the highest-impact reallocation available.	\$14,200/yr
02	Dispute 6 flagged invoices totaling \$3,840 in potential overcharges IQR analysis detected 6 shipments priced 36–147% above their lane median. Carrier C accounts for 4 of the 6 anomalies. Request itemized invoices immediately.	\$11,520/yr
03	Consolidate the Austin → Tulsa lane or reprice above \$2.10/mi This lane carries only 3 shipments at \$2.47/mi — the highest CPM in the network. Contribution margin is negative after fuel and accessorials.	\$8,400/yr

Carrier performance

72.4% Best on-time rate Carrier A	\$1.82/mi Lowest cost/mile Carrier A	41.3% Worst on-time rate Carrier B	\$2.47/mi Highest cost/mile Carrier C
--	---	---	--

Carrier A consistently outperforms all peers in both cost and reliability. It handles 22% of total volume despite having the best on-time rate (72.4%) and the lowest cost per mile (\$1.82). Carrier B handles 31% of volume with the worst on-time rate (41.3%) — meaning nearly half of your late deliveries trace back to a single carrier.

The linear programming model computes the optimal allocation across all four carriers. The recommended shift: move 18 shipments from Carrier B to Carrier A on the Dallas → Houston and Houston → OKC lanes. This improves fleet-wide on-time delivery from 58% to 67% while reducing average cost per shipment by \$96.

Carrier comparison

Carrier	Shipments	Avg cost	Cost/mi	On-time	Cost CV
Carrier A	31	\$982	\$1.82	72.4%	0.14
Carrier D	28	\$1,024	\$1.94	64.3%	0.18
Carrier C	39	\$1,089	\$2.12	53.8%	0.31
Carrier B	44	\$1,078	\$2.08	41.3%	0.24

Contingency analysis: Carrier A is 1.75x more likely to deliver on-time than Carrier B (72.4% vs 41.3%). If Carrier B experiences a service disruption, Carrier D is the recommended backup — similar capacity, 64.3% on-time rate, and \$1.94/mi cost per mile.

Cost variance flag: Carrier C has the highest cost coefficient of variation (0.31) — meaning their invoices are the most unpredictable. This makes budgeting unreliable. Recommend negotiating fixed lane rates with Carrier C or consolidating their volume with Carrier A.

Flagged invoices

6 shipments out of 142 (4.2%) were flagged as cost anomalies — priced significantly above the lane median based on IQR outlier detection. Total potential overpayment: \$3,840. Review these invoices with your carriers.

Shipment	Lane	Carrier	Actual	Median	Overpayment
SHP-4087	Austin → OKC	Carrier C	\$2,812	\$1,140	+\$1,672
SHP-4021	Dallas → Houston	Carrier B	\$1,420	\$980	+\$440
SHP-4103	Houston → Tulsa	Carrier C	\$1,680	\$1,200	+\$480
SHP-4156	Austin → Dallas	Carrier C	\$1,340	\$920	+\$420
SHP-4201	Dallas → OKC	Carrier B	\$1,560	\$1,180	+\$380
SHP-4089	Houston → Dallas	Carrier C	\$1,490	\$1,042	+\$448

Carrier C accounts for 4 of the 6 anomalies, suggesting a pattern of inconsistent pricing rather than isolated billing errors. The Austin → OKC shipment (SHP-4087) at \$2,812 is 147% above the lane median of \$1,140 — the single largest overpayment in the dataset.

Recommended action: Contact Carrier C with the 4 flagged shipment IDs and request itemized invoice breakdowns. Simultaneously, request competitive quotes from Carrier A for the Austin → OKC and Houston → Dallas lanes to establish rate leverage.

This is a 3-page sample. The full report is 15 pages.

The complete Freight Spend Intelligence Report includes driver performance profiles with SPC control charts, lane-by-lane contribution margin analysis, network balance and deadhead analysis, a full LP-optimized carrier allocation plan, and a 30-minute recorded video walkthrough of your results.
